

ANTI-GRAFFITI PRODUCT GUIDE

SAFETYZONE™ 
SAFETY AND SECURITY WINDOW FILM

HOW TO CHOOSE THE RIGHT HANITATEK ANTI-GRAFFITI SAFETYZONE FILM

HanitaTek offers two excellent Anti-Graffiti Films that set the standard in surface protection. Both films have scratch and chemical resistant coatings that protect against paint, ink, markers and other materials used for defacing property. Both films have outstanding clarity and ease of installation. Both films are designed for easy removal after they have been damaged in service. Here are the key differences in these two products:

6-Mil Anti-Graffiti Film – Product R17301G

- 6 mils thick means extra protection against gouging and deep scratches – the thicker the film, the greater the protection of the surface underneath.
- Resists ink, paint, scratches/gouges, and acid etching.
- Is designed primarily for interior applications. If applied to an exterior surface, it will last for some time and then break down due to UV radiation exposure. In many anti-graffiti applications, the film is expected to be damaged in service prior to any film breakdown due to UV exposure.

4-Mil Anti-Graffiti Film – Product R12305G

- Uses a superior “wipe clean” hardcoat designed to withstand multiple cleanings before the film needs to be replaced. Basically this is a better ink/paint/chemical resistant coating on the surface of the film.
- Has the same exterior application limitations as the 6-mil Anti-Graffiti film

FOR DEMANDING EXTERIOR APPLICATIONS

4-Mil Clear Exterior Safety Film – Product R12106X

- Designed for exterior use – UV durable hardcoat, polyester base materials mean longer life in exterior applications
- Similar ink/paint/chemical resistance to the 6-Mil Anti-Graffiti Film.
- Similar gouge resistance to the 4-Mil Anti-Graffiti Film.
